WHAT IS CLAIMED IS:

1	1. A method comprising:
2	a memory circuit receiving a data frame to be subsequently transmitted to a
3	destination device via a switching fabric, wherein the data frame
4	comprises header and data fields, and wherein the switching fabric
5	comprises a plurality of data ports through which data frames enter or exit
6	the switching fabric;
7	selecting a first multi-bit value [MASK] from a plurality of first multi-bit values
8	according to the data contained in the one of the header fields, wherein the
9	selected first multi-bit value comprises a plurality of bits;
10	selecting a second multi-bit value [FPOE] from a plurality of second multi-bit
11	values according to the data contained in the one of the header fields,
11 12 13	wherein the selected second multi-bit value comprises a plurality of bits;
13	wherein the bits of each of the first and second multi-bit values corresponds,
± 14	respectively, to the plurality of data ports;
15	bit wise logically ANDing the selected first and second multi-bit values to
16	produce a third multi-bit value;
17	adding the third multi-bit value to a header field of the received data frame;
18	transmitting the received data frame from the memory circuit to the switching
19	fabric after adding the third multi-bit value to the received data frame;
<u>20</u>	the data frame exiting the switching fabric through one or more data ports thereof
21	in accordance with the values of the bits of the third multi-bit value.

- The method of claim 1 wherein the memory circuit is coupled to the 2. switching fabric via a first pair of the plurality of data ports.
- The method of claim 2 wherein the data frame is transmitted to the 3. 1 2 switching fabric via one of the first pair of the plurality of data ports.

-17-

1

2

- 1 4. The method of claim 1 wherein the destination device is coupled to the switching fabric via a second pair of the plurality of data ports.
 - 5. The method of claim 4 where the data frame is transmitted to the destination device via one of the second pair of the plurality of data ports.
- 1 6. The method of claim 1 wherein each bit of the first multi-bit value is set to logical 1 or logical 0, wherein each bit set to logical 1 corresponds, respectively, to one of the plurality of data ports through which the data frame may exit the switching fabric to reach the destination device.
 - 7. The method of claim 4 wherein each bit of the second multi-bit value is set to logical 1 or logical 0, wherein a first of two bits of the second multi-bit value is set to logical 1, wherein a second of the two bits of the second multi-bit value is set to logical 0, and wherein the two bits correspond, respectively, to the second pair of the plurality of data ports.
 - 8. The method of claim 1 wherein only one bit of the third multi-bit value that is set to logical 1, and wherein the one bit corresponds to a particular data port of the plurality of data ports through which the data frame must exit the switching fabric to reach the destination device.

1	9.	An apparatus comprising:
2	a me	mory circuit configured to receive a data frame to be subsequently
3		transmitted to a destination device via a switching fabric, wherein the data
4		frame comprises header and data fields, and wherein the switching fabric
5		comprises a plurality of data ports through which data frames enter or exit
6		the switching fabric;
7	a firs	st circuit coupled to the memory circuit, wherein the first circuit is configured
8		to receive data from one of the header fields, and wherein the first circuit
9		is configured to produce a first multi-bit value in response to receiving the
10		data;
11	a sec	ond circuit coupled to the memory circuit, wherein the second circuit is
12		configured to receive the data, and wherein the second circuit is
13 14		configured to produce a second multi-bit value in response to receiving the
14		data;
15	a thir	ed circuit coupled to the first and second circuits, wherein the third circuit is
16 17		configured produce a third multi-bit value in response to receiving the first
17		and second multi-bit values from the first and second circuits,
18		respectively, wherein the third circuit is configured to add the third multi-
19		bit to a header field of the data frame;
1 20	wher	ein the memory circuit is configured to transmit the data frame to the
21		switching fabric after the third multi-bit value is added to the header field;
22	wher	ein the third multi-bit value identifies one of the plurality of data ports
23		through which the data frame must exit the switching fabric to reach the
24		destination device.

1 10. The apparatus of claim 9 wherein the memory circuit is coupled to the switching fabric via a first pair of the plurality of data ports.

- 12. The apparatus of claim 9 wherein each bit of the first multi-bit value is set to logical 1 or logical 0, wherein each bit set to logical 1 corresponds, respectively, to one of the plurality of data ports through which the data frame may exit the switching fabric to reach the destination device.
- 13. The apparatus of claim 9 wherein each bit of the second multi-bit value is set to logical 1 or logical 0, wherein each bit of the second multi-bit value that is set to logical 1 corresponds to a respective one of the plurality of data ports through which the first data frame may exit the switching fabric to reach one of a plurality of devices coupled to the switching fabric.
- 14. The apparatus of claim 9 wherein the third circuit is configured to bit wise logically AND the first and second multi-bit values.
- 15. The apparatus of claim 9 wherein only one bit of the third multi-bit value that is set to logical 1, and wherein the one bit corresponds to a particular data port of the plurality of data ports through which the data frame must exit the switching fabric to reach the destination device.
